Fine-Tune a Generative AI Model for Dialogue Summarization

In this notebook, you will fine-tune an existing LLM from Hugging Face for enhanced dialogue summarization. You will use the FLAN-T5 model, which provides a high quality instruction tuned model and can summarize text out of the box. To improve the inferences, you will explore a full fine-tuning approach and evaluate the results with ROUGE metrics. Then you will perform Parameter Efficient Fine-Tuning (PEFT), evaluate the resulting model and see that the benefits of PEFT outweigh the slightly-lower performance metrics.

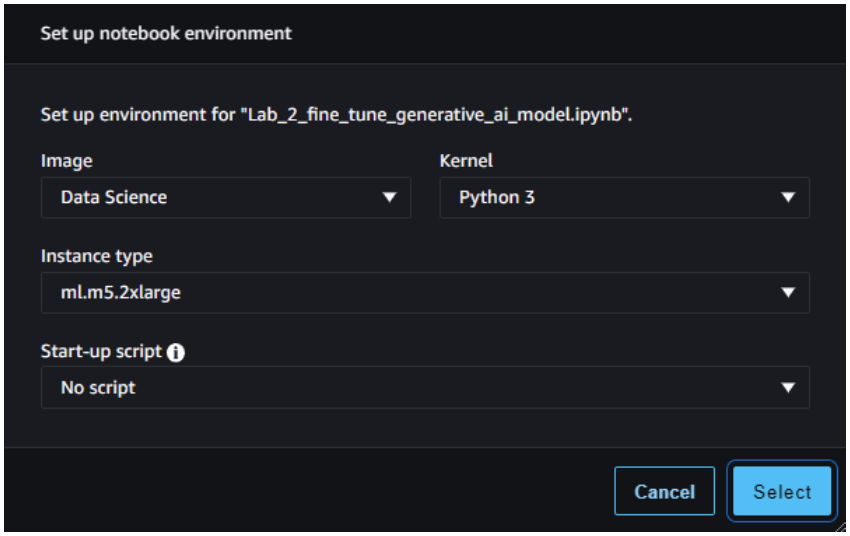
Table of Contents

1 - Set up Kernel, Load Required Dependencies, Dataset and LLM

1.1 - Set up Kernel and Required Dependencies

To begin with, check that the kernel is selected correctly.

If you click on that (top right of the screen), you'll be able to see and check the details of the image, kernel, and instance type.



Now install the required packages for the LLM and datasets.

The next cell may take a few minutes to run. Please be patient.
Ignore the warnings and errors, along with the note about restarting the kernel at the end.

Changed to markdown not to install in local envoronment. I have updated to latest versions of libraries.

%pip install --upgrade pip %pip install --disable-pip-version-check
torch==1.13.1
torchdata==0.5.1 --quiet

%pip install
transformers==4.27.2
datasets==2.11.0
evaluate==0.4.0
rouge_score==0.1.2
loralib==0.1.1
peft==0.3.0 --quiet

Import the necessary components. Some of them are new for this week, they will be discussed later in the notebook.

In [ ]:
```
from datasets import load_dataset
from transformers import AutoModelForSeq2SeqLM, AutoTokenizer, GenerationConfig, TrainingArguments, Trainer
import torch
import time
import evaluate
import pandas as pd
import numpy as np
```

1.2 - Load Dataset and LLM

You are going to continue experimenting with the DialogSum Hugging Face dataset. It contains 10,000+ dialogues with the corresponding manually labeled summaries and topics.

In [ ]:
```
huggingface_dataset_name = "knkarthick/dialogsum"

dataset = load_dataset(huggingface_dataset_name)

dataset
```

Out[ ]:
```
DatasetDict({
    train: Dataset({
        features: ['id', 'dialogue', 'summary', 'topic'],
        num_rows: 12460
    })
    validation: Dataset({
        features: ['id', 'dialogue', 'summary', 'topic'],
        num_rows: 500
    })
    test: Dataset({
        features: ['id', 'dialogue', 'summary', 'topic'],
        num_rows: 1500
    })
})
```

In [ ]:
```
dataset['train'][1]
```

Out[ ]:
```
{'id': 'train_1',
 'dialogue': "#Person1#: Hello Mrs. Parker, how have you been?\n#Person2#: Hello Dr. Peters. Just fine thank you. Ricky a
nd I are here for his vaccines.\n#Person1#: Very well. Let's see, according to his vaccination record, Ricky has received
his Polio, Tetanus and Hepatitis B shots. He is 14 months old, so he is due for Hepatitis A, Chickenpox and Measles shot
s.\n#Person2#: What about Rubella and Mumps?\n#Person1#: Well, I can only give him these for now, and after a couple of w
eeks I can administer the rest.\n#Person2#: OK, great. Doctor, I think I also may need a Tetanus booster. Last time I got
it was maybe fifteen years ago!\n#Person1#: We will check our records and I'll have the nurse administer and the booster
as well. Now, please hold Ricky's arm tight, this may sting a little.",
 'summary': 'Mrs Parker takes Ricky for his vaccines. Dr. Peters checks the record and then gives Ricky a vaccine.',
 'topic': 'vaccines'}
```

Load the pre-trained FLAN-T5 model and its tokenizer directly from HuggingFace. Notice that you will be using the small version of FLAN-T5. Setting `torch_dtype=torch.bfloat16` specifies the memory type to be used by this model.

In [ ]:
```
model_name='google/flan-t5-base'

original_model = AutoModelForSeq2SeqLM.from_pretrained(model_name, torch_dtype=torch.bfloat16)
tokenizer = AutoTokenizer.from_pretrained(model_name)
```

It is possible to pull out the number of model parameters and find out how many of them are trainable. The following function can be

used to do that, at this stage, you do not need to go into details of it.

In [ ]:
```
def print_number_of_trainable_model_parameters(model):
    trainable_model_params = 0
    all_model_params = 0
    for _, param in model.named_parameters():
        all_model_params += param.numel()
        if param.requires_grad:
            trainable_model_params += param.numel()
    return f"trainable model parameters: {trainable_model_params}\nall model parameters: {all_model_params}\npercentage of

print(print_number_of_trainable_model_parameters(original_model))
```

```
trainable model parameters: 247577856
all model parameters: 247577856
percentage of trainable model parameters: 100.00%
```

1.3 - Test the Model with Zero Shot Inferencing

Test the model with the zero shot inferencing. You can see that the model struggles to summarize the dialogue compared to the baseline summary, but it does pull out some important information from the text which indicates the model can be fine-tuned to the task at hand.

In [ ]:
```
index = 200

dialogue = dataset['test'][index]['dialogue']
summary = dataset['test'][index]['summary']

prompt = f"""
Summarize the following conversation.

{dialogue}

Summary:
"""

inputs = tokenizer(prompt, return_tensors='pt')
output = tokenizer.decode(
    original_model.generate(
        inputs["input_ids"],
        max_new_tokens=200,
    )[0],
    skip_special_tokens=True
)

dash_line = '-'.join('' for x in range(100))
print(dash_line)
print(f'INPUT PROMPT:\n{prompt}')
print(dash_line)
print(f'BASELINE HUMAN SUMMARY:\n{summary}\n')
print(dash_line)
print(f'MODEL GENERATION - ZERO SHOT:\n{output}')
```

```
----------------------------------------------------------------------------------------------------
INPUT PROMPT:

Summarize the following conversation.

#Person1#: Have you considered upgrading your system?
#Person2#: Yes, but I'm not sure what exactly I would need.
#Person1#: You could consider adding a painting program to your software. It would allow you to make up your own flyers and
banners for advertising.
#Person2#: That would be a definite bonus.
#Person1#: You might also want to upgrade your hardware because it is pretty outdated now.
#Person2#: How can we do that?
#Person1#: You'd probably need a faster processor, to begin with. And you also need a more powerful hard disc, more memory
and a faster modem. Do you have a CD-ROM drive?
#Person2#: No.
#Person1#: Then you might want to add a CD-ROM drive too, because most new software programs are coming out on Cds.
#Person2#: That sounds great. Thanks.

Summary:

----------------------------------------------------------------------------------------------------
BASELINE HUMAN SUMMARY:
#Person1# teaches #Person2# how to upgrade software and hardware in #Person2#'s system.

----------------------------------------------------------------------------------------------------
MODEL GENERATION - ZERO SHOT:
#Person1#: I'm thinking of upgrading my computer.
```

2 - Perform Full Fine-Tuning

2.1 - Preprocess the Dialog-Summary Dataset

You need to convert the dialog-summary (prompt-response) pairs into explicit instructions for the LLM. Prepend an instruction to the start of the dialog with `Summarize the following conversation` and to the start of the summary with `Summary` as follows:

Training prompt (dialogue):

```
Summarize the following conversation.

    Chris: This is his part of the conversation.
    Antje: This is her part of the conversation.

Summary:
```

Training response (summary):

```
Both Chris and Antje participated in the conversation.
```

Then preprocess the prompt-response dataset into tokens and pull out their `input_ids` (1 per token).

In [ ]:
```
def tokenize_function(example):
    start_prompt = 'Summarize the following conversation.\n\n'
    end_prompt = '\n\nSummary: '
    prompt = [start_prompt + dialogue + end_prompt for dialogue in example["dialogue"]]
    example['input_ids'] = tokenizer(prompt, padding="max_length", truncation=True, return_tensors="pt").input_ids
    example['labels'] = tokenizer(example["summary"], padding="max_length", truncation=True, return_tensors="pt").input_id

    return example

# The dataset actually contains 3 diff splits: train, validation, test.
# The tokenize_function code is handling all data across all splits in batches.
tokenized_datasets = dataset.map(tokenize_function, batched=True)
tokenized_datasets = tokenized_datasets.remove_columns(['id', 'topic', 'dialogue', 'summary',])
```

```
Map:   0%|          | 0/500 [00:00<?, ? examples/s]
```

In [ ]:
```
tokenized_datasets
```

Out[ ]:
```
DatasetDict({
    train: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 125
    })
    validation: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 5
    })
    test: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 15
    })
})
```

In [ ]:
```
tokenized_datasets['train'][1]
```

Out[ ]:

```

 0]}
```

To save some time in the lab, you will subsample the dataset:

```
In [ ]: tokenized_datasets = tokenized_datasets.filter(lambda example, index: index % 100 == 0, with_indices=True)
```

```
Filter:   0%|          | 0/500 [00:00<?, ? examples/s]
```

Check the shapes of all three parts of the dataset:

In [ ]:
```
print(f"Shapes of the datasets:")
print(f"Training: {tokenized_datasets['train'].shape}")
print(f"Validation: {tokenized_datasets['validation'].shape}")
print(f"Test: {tokenized_datasets['test'].shape}")

print(tokenized_datasets)
```

```
Shapes of the datasets:
Training: (125, 2)
Validation: (5, 2)
Test: (15, 2)
DatasetDict({
    train: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 125
    })
    validation: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 5
    })
    test: Dataset({
        features: ['input_ids', 'labels'],
        num_rows: 15
    })
})
```

The output dataset is ready for fine-tuning.

2.2 - Fine-Tune the Model with the Preprocessed Dataset

Now utilize the built-in Hugging Face `Trainer` class (see the documentation here). Pass the preprocessed dataset with reference to the original model. Other training parameters are found experimentally and there is no need to go into details about those at the moment.

In [ ]:
```
output_dir = f'./dialogue-summary-training-{str(int(time.time()))}'

training_args = TrainingArguments(
    output_dir=output_dir,
    learning_rate=1e-5,
    num_train_epochs=1, # default set to 1 to speed up training, try 5 or more
    weight_decay=0.01,
    logging_steps=1,
    max_steps=1 # default set to 1 to speed up training, try 100 if you have time and compare results with 1 max_steps
)

trainer = Trainer(
    model=original_model,
    args=training_args,
    train_dataset=tokenized_datasets['train'],
    eval_dataset=tokenized_datasets['validation']
)
```

Start training process...

The next cell may take a few minutes to run. Please be patient.
You can safely ignore the warning messages.

In [ ]:
```
trainer.train()
```

```
c:\Miniconda3\lib\site-packages\transformers\optimization.py:391: FutureWarning: This implementation of AdamW is deprecated and will be removed in a future version. Use the PyTorch implementation torch.optim.AdamW instead, or set `no_deprecation_warning=True` to disable this warning
  warnings.warn(
  0%|          | 0/1 [00:00<?, ?it/s]
{'loss': 49.5, 'learning_rate': 0.0, 'epoch': 0.06}
{'train_runtime': 9811.5012, 'train_samples_per_second': 0.001, 'train_steps_per_second': 0.0, 'train_loss': 49.5, 'epoch': 0.06}
```

Out[ ]:
```
TrainOutput(global_step=1, training_loss=49.5, metrics={'train_runtime': 9811.5012, 'train_samples_per_second': 0.001, 'train_steps_per_second': 0.0, 'train_loss': 49.5, 'epoch': 0.06})
```

Training a fully fine-tuned version of the model would take a few hours on a GPU. To save time, download a checkpoint of the fully fine-

tuned model to use in the rest of this notebook. This fully fine-tuned model will also be referred to as the **instruct model** in this lab.

In [ ]:
```
#!aws s3 cp --recursive s3://dlai-generative-ai/models/flan-dialogue-summary-checkpoint/ ./flan-dialogue-summary-checkpoin

## To get instruct model that has been trained with more epoch (probably 5) and steps (probably 100)

# use wget
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/pytorch_model.bin -P ./flan-dialo
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/generation_config.json -P ./flan-
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/trainer_state.json -P ./flan-dial
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/training_args.bin -P ./flan-dialo
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/config.json -P ./flan-dialogue-su
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/scheduler.pt -P ./flan-dialogue-s
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/rng_state.pth -P ./flan-dialogue-
!wget http://dlai-generative-ai.s3.amazonaws.com/models/flan-dialogue-summary-checkpoint/optimizer.pt -P ./flan-dialogue-s
```

The size of the downloaded instruct model is approximately 1GB.

In [ ]:
```
# Check what has been downloaded
!ls -s -A  ./flan-dialogue-summary-checkpoint/
```

```
total 2901606
      4 config.json
      1 generation_config.json
1934368 optimizer.pt
 967200 pytorch_model.bin
     16 rng_state.pth
      1 scheduler.pt
     12 trainer_state.json
      4 training_args.bin
```

Create an instance of the `AutoModelForSeq2SeqLM` class for the instruct model:

In [ ]:
```
instruct_model = AutoModelForSeq2SeqLM.from_pretrained("./flan-dialogue-summary-checkpoint", torch_dtype=torch.bfloat16)
```

2.3 - Evaluate the Model Qualitatively (Human Evaluation)

As with many GenAI applications, a qualitative approach where you ask yourself the question "Is my model behaving the way it is supposed to?" is usually a good starting point. In the example below (the same one we started this notebook with), you can see how the fine-tuned model is able to create a reasonable summary of the dialogue compared to the original inability to understand what is being asked of the model.

In [ ]:
```
index = 200
dialogue = dataset['test'][index]['dialogue']
human_baseline_summary = dataset['test'][index]['summary']

prompt = f"""
Summarize the following conversation.

{dialogue}

Summary:
"""

input_ids = tokenizer(prompt, return_tensors="pt").input_ids

original_model_outputs = original_model.generate(input_ids=input_ids, generation_config=GenerationConfig(max_new_tokens=20
original_model_text_output = tokenizer.decode(original_model_outputs[0], skip_special_tokens=True)

instruct_model_outputs = instruct_model.generate(input_ids=input_ids, generation_config=GenerationConfig(max_new_tokens=20
instruct_model_text_output = tokenizer.decode(instruct_model_outputs[0], skip_special_tokens=True)

print(dash_line)
print(f'BASELINE HUMAN SUMMARY:\n{human_baseline_summary}')
print(dash_line)
print(f'ORIGINAL MODEL:\n{original_model_text_output}')
print(dash_line)
print(f'INSTRUCT MODEL:\n{instruct_model_text_output}')
```

```
---------------------------------------------------------------------------------------------------
BASELINE HUMAN SUMMARY:
#Person1# teaches #Person2# how to upgrade software and hardware in #Person2#'s system.
---------------------------------------------------------------------------------------------------
ORIGINAL MODEL:
#Person1#: I'm thinking of upgrading my computer.
---------------------------------------------------------------------------------------------------
INSTRUCT MODEL:
#Person1# suggests #Person2# upgrading #Person2#'s system, hardware, and CD-ROM drive. #Person2# thinks it's great.
```

2.4 - Evaluate the Model Quantitatively (with ROUGE Metric)

The ROUGE metric) helps quantify the validity of summarizations produced by models. It compares summarizations to a "baseline" summary which is usually created by a human. While not perfect, it does indicate the overall increase in summarization effectiveness that we have accomplished by fine-tuning.

In [ ]:
```
rouge = evaluate.load('rouge')
```

Generate the outputs for the sample of the test dataset (only 10 dialogues and summaries to save time), and save the results.

In [ ]:
```
dialogues = dataset['test'][0:10]['dialogue']
human_baseline_summaries = dataset['test'][0:10]['summary']

original_model_summaries = []
instruct_model_summaries = []

for _, dialogue in enumerate(dialogues):
    prompt = f"""
Summarize the following conversation.

{dialogue}

Summary: """
    input_ids = tokenizer(prompt, return_tensors="pt").input_ids

    original_model_outputs = original_model.generate(input_ids=input_ids, generation_config=GenerationConfig(max_new_token
    original_model_text_output = tokenizer.decode(original_model_outputs[0], skip_special_tokens=True)
    original_model_summaries.append(original_model_text_output)

    instruct_model_outputs = instruct_model.generate(input_ids=input_ids, generation_config=GenerationConfig(max_new_token
    instruct_model_text_output = tokenizer.decode(instruct_model_outputs[0], skip_special_tokens=True)
    instruct_model_summaries.append(instruct_model_text_output)

zipped_summaries = list(zip(human_baseline_summaries, original_model_summaries, instruct_model_summaries))

df = pd.DataFrame(zipped_summaries, columns = ['human_baseline_summaries', 'original_model_summaries', 'instruct_model_sum
df
```

Out[ ]:

Evaluate the models computing ROUGE metrics. Notice the improvement in the results!

In [ ]:
```
original_model_results = rouge.compute(
    predictions=original_model_summaries,
    references=human_baseline_summaries[0:len(original_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

instruct_model_results = rouge.compute(
    predictions=instruct_model_summaries,
    references=human_baseline_summaries[0:len(instruct_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)
```

```
print('ORIGINAL MODEL:')
print(original_model_results)
print('INSTRUCT MODEL:')
print(instruct_model_results)
```

```
ORIGINAL MODEL:
{'rouge1': 0.2334158581572823, 'rouge2': 0.07603964187010573, 'rougeL': 0.20145520923859048, 'rougeLsum': 0.201458993390061
35}
INSTRUCT MODEL:
{'rouge1': 0.42161291557556113, 'rouge2': 0.18035380596301792, 'rougeL': 0.3384439349963909, 'rougeLsum': 0.338356535955616
66}
```

The file `data/dialogue-summary-training-results.csv` contains a pre-populated list of all model results which you can use to evaluate on a larger section of data. Let's do that for each of the models:

In [ ]:
```
results = pd.read_csv("data/dialogue-summary-training-results.csv")

human_baseline_summaries = results['human_baseline_summaries'].values
original_model_summaries = results['original_model_summaries'].values
instruct_model_summaries = results['instruct_model_summaries'].values

original_model_results = rouge.compute(
    predictions=original_model_summaries,
    references=human_baseline_summaries[0:len(original_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

instruct_model_results = rouge.compute(
    predictions=instruct_model_summaries,
    references=human_baseline_summaries[0:len(instruct_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

print('ORIGINAL MODEL:')
print(original_model_results)
print('INSTRUCT MODEL:')
print(instruct_model_results)
```

```
ORIGINAL MODEL:
{'rouge1': 0.2334158581572823, 'rouge2': 0.07603964187010573, 'rougeL': 0.20145520923859048, 'rougeLsum': 0.201458993390061
35}
INSTRUCT MODEL:
{'rouge1': 0.42161291557556113, 'rouge2': 0.18035380596301792, 'rougeL': 0.3384439349963909, 'rougeLsum': 0.338356535955616
66}
```

The results show substantial improvement in all ROUGE metrics:

In [ ]:
```
print("Absolute percentage improvement of INSTRUCT MODEL over HUMAN BASELINE")

improvement = (np.array(list(instruct_model_results.values())) - np.array(list(original_model_results.values())))
for key, value in zip(instruct_model_results.keys(), improvement):
    print(f'{key}: {value*100:.2f}%')
```

```
Absolute percentage improvement of INSTRUCT MODEL over HUMAN BASELINE
rouge1: 18.82%
rouge2: 10.43%
rougeL: 13.70%
rougeLsum: 13.69%
```

3 - Perform Parameter Efficient Fine-Tuning (PEFT)

Now, let's perform **Parameter Efficient Fine-Tuning (PEFT)** fine-tuning as opposed to "full fine-tuning" as you did above. PEFT is a form of instruction fine-tuning that is much more efficient than full fine-tuning - with comparable evaluation results as you will see soon.

PEFT is a generic term that includes **Low-Rank Adaptation (LoRA)** and prompt tuning (which is NOT THE SAME as prompt engineering!). In most cases, when someone says PEFT, they typically mean LoRA. LoRA, at a very high level, allows the user to fine-tune their model using fewer compute resources (in some cases, a single GPU). After fine-tuning for a specific task, use case, or tenant with LoRA, the result is that the original LLM remains unchanged and a newly-trained "LoRA adapter" emerges. This LoRA adapter is much, much smaller than the original LLM - on the order of a single-digit % of the original LLM size (MBs vs GBs).

That said, at inference time, the LoRA adapter needs to be reunited and combined with its original LLM to serve the inference request. The benefit, however, is that many LoRA adapters can re-use the original LLM which reduces overall memory requirements when serving multiple tasks and use cases.

3.1 - Setup the PEFT/LoRA model for Fine-Tuning

You need to set up the PEFT/LoRA model for fine-tuning with a new layer/parameter adapter. Using PEFT/LoRA, you are freezing the

underlying LLM and only training the adapter. Have a look at the LoRA configuration below. Note the rank (`r`) hyper-parameter, which defines the rank/dimension of the adapter to be trained.

In [ ]:
```
from peft import LoraConfig, get_peft_model, TaskType

lora_config = LoraConfig(
    r=32, # Rank
    lora_alpha=32,
    target_modules=["q", "v"],
    lora_dropout=0.05,
    bias="none",
    task_type=TaskType.SEQ_2_SEQ_LM # FLAN-T5
)
```

Add LoRA adapter layers/parameters to the original LLM to be trained.

In [ ]:
```
peft_model = get_peft_model(original_model,
                            lora_config)
print(print_number_of_trainable_model_parameters(peft_model))
```

```
trainable model parameters: 3538944
all model parameters: 251116800
percentage of trainable model parameters: 1.41%
```

3.2 - Train PEFT Adapter

Define training arguments and create `Trainer` instance.

In [ ]:
```
output_dir = f'./peft-dialogue-summary-training-{str(int(time.time()))}'

peft_training_args = TrainingArguments(
    output_dir=output_dir,
    auto_find_batch_size=True,
    learning_rate=1e-3, # Higher learning rate than full fine-tuning.
    num_train_epochs=1, # small number for convinience of training speed
    logging_steps=1,
    max_steps=1  # small number for convinience of training speed
)

peft_trainer = Trainer(
    model=peft_model,
    args=peft_training_args,
    train_dataset=tokenized_datasets["train"],
)
```

Now everything is ready to train the PEFT adapter and save the model.

The next cell may take a few minutes to run.

In [ ]:
```
peft_trainer.train()

peft_model_path="./peft-dialogue-summary-checkpoint-local"

peft_trainer.model.save_pretrained(peft_model_path)
tokenizer.save_pretrained(peft_model_path)
```

Out[ ]:
```
('./peft-dialogue-summary-checkpoint-local\\tokenizer_config.json',
 './peft-dialogue-summary-checkpoint-local\\special_tokens_map.json',
 './peft-dialogue-summary-checkpoint-local\\tokenizer.json')
```

That training was performed on a subset of data. To load a fully trained PEFT model, read a checkpoint of a PEFT model from S3.

In [ ]:
```
# Download from the AWS bucket manually
# !aws s3 cp --recursive s3://dlai-generative-ai/models/peft-dialogue-summary-checkpoint/ ./peft-dialogue-summary-checkpoi

!wget  http://dlai-generative-ai.s3.amazonaws.com/models/peft-dialogue-summary-checkpoint/adapter_config.json -P ./peft-di
!wget  http://dlai-generative-ai.s3.amazonaws.com/models/peft-dialogue-summary-checkpoint/special_tokens_map.json -P ./pef
!wget  http://dlai-generative-ai.s3.amazonaws.com/models/peft-dialogue-summary-checkpoint/tokenizer_config.json  -P ./peft
!wget  http://dlai-generative-ai.s3.amazonaws.com/models/peft-dialogue-summary-checkpoint/tokenizer.json  -P ./peft-dialog
!wget  http://dlai-generative-ai.s3.amazonaws.com/models/peft-dialogue-summary-checkpoint/adapter_model.bin -P ./peft-dial
```

Check that the size of this model is much less than the original LLM:

In [ ]:
```
!ls -s ./peft-dialogue-summary-checkpoint-from-s3/
```

```
total 16253
    1 adapter_config.json
13876 adapter_model.bin
    4 special_tokens_map.json
 2368 tokenizer.json
    4 tokenizer_config.json
```

Prepare this model by adding an adapter to the original FLAN-T5 model. You are setting `is_trainable=False` because the plan is only to perform inference with this PEFT model. If you were preparing the model for further training, you would set `is_trainable=True` .

In [ ]:
```
from safetensors import safe_open
from diffusers import StableDiffusionPipeline, EulerDiscreteScheduler
```

In [ ]:
```
from peft import PeftModel, PeftConfig

peft_model_base = AutoModelForSeq2SeqLM.from_pretrained("./google/flan-t5-base/", torch_dtype=torch.bfloat16)
tokenizer = AutoTokenizer.from_pretrained("google/flan-t5-base")

peft_model = PeftModel.from_pretrained(peft_model_base,
                                       './peft-dialogue-summary-checkpoint-from-s3/',
                                       torch_dtype=torch.bfloat16,
                                       is_trainable=False) # will not train the model, just use the forward pass(inference
```

The number of trainable parameters will be `0` due to `is_trainable=False` setting:

In [ ]:
```
print(print_number_of_trainable_model_parameters(peft_model))
```

```
trainable model parameters: 0
all model parameters: 251116800
percentage of trainable model parameters: 0.00%
```

3.3 - Evaluate the Model Qualitatively (Human Evaluation)

Make inferences for the same example as in sections 1.3 and 2.3, with the original model, fully fine-tuned and PEFT model.

In [ ]:
```
index = 200
dialogue = dataset['test'][index]['dialogue']
baseline_human_summary = dataset['test'][index]['summary']

prompt = f"""
Summarize the following conversation.

Compute ROUGE score for this subset of the data.

In [ ]:
```
rouge = evaluate.load('rouge')

original_model_results = rouge.compute(
    predictions=original_model_summaries,
    references=human_baseline_summaries[0:len(original_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

instruct_model_results = rouge.compute(
    predictions=instruct_model_summaries,
```

```
    references=human_baseline_summaries[0:len(instruct_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

peft_model_results = rouge.compute(
    predictions=peft_model_summaries,
    references=human_baseline_summaries[0:len(peft_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

print('ORIGINAL MODEL:')
print(original_model_results)
print('INSTRUCT MODEL:')
print(instruct_model_results)
print('PEFT MODEL:')
print(peft_model_results)
```

```
ORIGINAL MODEL:
{'rouge1': 0.241950545026632, 'rouge2': 0.1179539641943734, 'rougeL': 0.22166387959866218, 'rougeLsum': 0.2228394029480986
2}
INSTRUCT MODEL:
{'rouge1': 0.4015906463624618, 'rouge2': 0.17568542724181807, 'rougeL': 0.2874569966059625, 'rougeLsum': 0.288632761308429
4}
PEFT MODEL:
{'rouge1': 0.3725351062275605, 'rouge2': 0.12138811933618107, 'rougeL': 0.27620639623170606, 'rougeLsum': 0.275813487082236
2}
```

Notice, that PEFT model results are not too bad, while the training process was much easier!

You already computed ROUGE score on the full dataset, after loading the results from the `data/dialogue-summary-training-results.csv` file. Load the values for the PEFT model now and check its performance compared to other models.

In [ ]:
```
human_baseline_summaries = results['human_baseline_summaries'].values
original_model_summaries = results['original_model_summaries'].values
instruct_model_summaries = results['instruct_model_summaries'].values
peft_model_summaries     = results['peft_model_summaries'].values

original_model_results = rouge.compute(
    predictions=original_model_summaries,
    references=human_baseline_summaries[0:len(original_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

instruct_model_results = rouge.compute(
    predictions=instruct_model_summaries,
    references=human_baseline_summaries[0:len(instruct_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

peft_model_results = rouge.compute(
    predictions=peft_model_summaries,
    references=human_baseline_summaries[0:len(peft_model_summaries)],
    use_aggregator=True,
    use_stemmer=True,
)

print('ORIGINAL MODEL:')
print(original_model_results)
print('INSTRUCT MODEL:')
print(instruct_model_results)
print('PEFT MODEL:')
print(peft_model_results)
```

```
ORIGINAL MODEL:
{'rouge1': 0.2334158581572823, 'rouge2': 0.07603964187010573, 'rougeL': 0.20145520923859048, 'rougeLsum': 0.201458993390061
35}
INSTRUCT MODEL:
{'rouge1': 0.42161291557556113, 'rouge2': 0.18035380596301792, 'rougeL': 0.3384439349963909, 'rougeLsum': 0.338356535955616
66}
PEFT MODEL:
{'rouge1': 0.40810631575616746, 'rouge2': 0.1633255794568712, 'rougeL': 0.32507074586565354, 'rougeLsum': 0.324895018286709
1}
```

The results show less of an improvement over full fine-tuning, but the benefits of PEFT typically outweigh the slightly-lower performance metrics.

Calculate the improvement of PEFT over the original model:

In [ ]:
```
print("Absolute percentage improvement of PEFT MODEL over HUMAN BASELINE")

improvement = (np.array(list(peft_model_results.values())) - np.array(list(original_model_results.values())))
```

```
for key, value in zip(peft_model_results.keys(), improvement):
    print(f'{key}: {value*100:.2f}%')
```

```
Absolute percentage improvement of PEFT MODEL over HUMAN BASELINE
rouge1: 17.47%
rouge2: 8.73%
rougeL: 12.36%
rougeLsum: 12.34%
```

Now calculate the improvement of PEFT over a full fine-tuned model:

In [ ]:
```
print("Absolute percentage improvement of PEFT MODEL over INSTRUCT MODEL")

improvement = (np.array(list(peft_model_results.values())) - np.array(list(instruct_model_results.values())))
for key, value in zip(peft_model_results.keys(), improvement):
    print(f'{key}: {value*100:.2f}%')
```

```
Absolute percentage improvement of PEFT MODEL over INSTRUCT MODEL
rouge1: -1.35%
rouge2: -1.70%
rougeL: -1.34%
rougeLsum: -1.35%
```

Here you see a small percentage decrease in the ROUGE metrics vs. full fine-tuned. However, the training requires much less computing and memory resources (often just a single GPU).
